

School of Science MATH 200 Statistics for the Physical and Life Sciences Term: Winter 2023 Number of Credits: 3

# **Course Outline**

INSTRUCTOR: Amy Feaver, PhD, MA, BS OFFICE LOCATION: N/A CONTACT DETAILS: afeaver@yukonu.ca OFFICE HOURS: please email **COURSE DATES:** Jan. 5 – April 11, 2023 **TIME(S):** Tues. & Thurs 6:00 – 7:30 **CLASSROOM:** A2101 *and online* 

### **COURSE DESCRIPTION**

This course provides a comprehensive introduction to statistical principles and methods. At the end of the course, students should be able to utilize statistical techniques to characterize and assess research datasets and critically evaluate statistical work done by others. Topics include descriptive statistics, elementary concepts in probability, correlation and regression, sampling, estimation and hypothesis testing (including one-sample, two-sample, ANOVA, and chi-squared). This course is directed towards undergraduate science and engineering students for which fluency in basic statistical methods can greatly contribute to the depth of their core program.

#### **COURSE REQUIREMENTS**

Prerequisite(s): Successful completion of MATH 100 (Single Variable Calculus I), MATH 120 (Mathematics for the Life Sciences) or permission of the instructor.

#### **EQUIVALENCY OR TRANSFERABILITY**

Receiving institutions determine course transferability. Find further information at: <u>https://www.yukonu.ca/admissions/transfer-credit</u>

#### **LEARNING OUTCOMES**

Upon successful completion of the course, students will be able to:

- Apply the techniques of descriptive statistics in order to organize and analyze data (using histogram, mean, median, mode, and standard deviation).
- Demonstrate an understanding of probability (simple/addition/multiplication/conditional) and counting rules (combinations and permutations).
- Apply hypothesis tests to means, proportions, and variances.
- Demonstrate an understanding of ANOVA and nonparametric statistics.
- Apply the techniques of inferential statistics (correlation and regression).
- Present the findings of a research project that employs the statistical techniques learned throughout the course to a real-world, local dataset.

### **COURSE FORMAT**

*Lectures: 3 hours per week, Tutorial: 1 hour per week (optional)* The first lecture in each week (Tues) will be conducted online (synchronously) via Zoom and the second lecture will be conducted in person, with the option for remote attendance.

The course content is covered through lectures, tutorials, and assignments. Students are expected to prepare for each class by doing assigned readings from the textbook and are also expected to engage in substantial self-directed review and practice of the material. One should plan on spending between 3-4 hours in study and preparation outside class for each hour spent in class.

### **EVALUATION**

Assignments	20%
Quizzes	10%
Midterm Exam	20%
Final Exam	30%
Research Project	20%
Total	100%

### Assignments (20%)

Three take-home assignments will be distributed by the instructor over the course of the semester. Late assignments will be graded based on the following scheme: a deduction of 10% per business day up until a total deduction of 50% is reached. Following that, assignments will no longer be accepted and will receive a mark of zero (F).

## Quizzes (10%)

There will be five quizzes administered during the term, all through the University's online learning management system (Moodle). Many questions on the quizzes will draw heavily on the techniques mastered while completing the assigned problem sets. Missed quizzes cannot be made up unless prior arrangements have been made with the instructor.

### **Research Project (20%)**

Students will complete an independent research project where they will apply the statistical techniques learned in the course to a scientific dataset from their own field of study. Students are encouraged to contact faculty members in their respective programs at the start of the semester; the course instructor will assist in obtaining datasets if needed, and vet those provided by School of Science faculty for suitability for the class project. The project will involve both oral and written components and be due during the last week of class. Smaller components of the project will be due at various points throughout the term to ensure forward progress. More information on the project will be presented in the first few weeks of class.

#### Exams

There will be one midterm exam worth 20% of the final mark.

The final examination will cover the entire course and is worth 30% of the final mark. It will be held at the end of the term during the exam period. The exact date of the examination is available on the course website from the date that registration is available. Students should contact their instructor immediately if conflicts arise.

### **COURSE WITHDRAWAL INFORMATION**

Refer to the YukonU website for important dates.

### **TEXTBOOKS & LEARNING MATERIALS**

### Textbook

Triola, M.F., Goodman, W.M., Law, R., and LaBute, G. 2011. Elementary Statistics (3<sup>rd</sup> Canadian Edition). Pearson Canada: ISBN: 9780321225979

### **Supporting Materials**

In addition to the textbook, some students may find it helpful to supplement their reading with free online resources. Excellent online resources include:

- Introductory Statistics, OpenStax <u>www.openstax.org/details/introductory-statistics</u> This is a free textbook, available online in PDF or web view format.
- Khan Academy: Probability and Statistics <u>https://www.khanacademy.org/math/probability</u> Use it for: Short YouTube videos explaining each concept.

### Calculator

You will require a scientific calculator for this course. It need not be a graphing calculator, but it should have a statistics function and be capable of square roots, powers, exponents, factorials, etc.

### ACADEMIC INTEGRITY

Students are expected to contribute toward a positive and supportive environment and are required to conduct themselves in a responsible manner. Academic misconduct includes all forms of academic dishonesty such as cheating, plagiarism, fabrication, fraud, deceit, using the work of others without their permission, aiding other students in committing academic offences, misrepresenting academic assignments prepared by others as one's own, or any other forms of academic dishonesty including falsification of any information on any Yukon University document.

Please refer to Academic Regulations & Procedures for further details about academic standing and student rights and responsibilities.

### ACADEMIC ACCOMMODATION

Reasonable accommodations are available for students requiring an academic accommodation to fully participate in this class. These accommodations are available for students with a documented disability,

chronic condition or any other grounds specified in section 8.0 of the Yukon University Academic Regulations (available on the Yukon University website). It is the student's responsibility to seek these accommodations by contacting the Learning Assistance Centre (LAC): <u>LearningAssistanceCentre@yukonu.ca</u>.

### **TOPIC OUTLINE**

Module	Topic(s)
1	Introduction to Statistics: Statistical thinking and types of statistics; types of
	variables; populations and samples; scales of measurement; precision and
	accuracy; summation notation.
2	Summarizing & Graphing Data: Grouped versus ungrouped data; frequency
	distributions and tables; relative frequency and percentage distributions; outliers,
	bar graphs, pie charts, histograms, dotplots and stem-and-leaf displays; implied
	class limits; class intervals and class mark.
3	Numerical Descriptive Statistics: Measures of central tendency and dispersion for
	ungrouped data; mean, variance, and standard deviation for grouped data;
	relative standing/measures of position and box-and-whisker plots; sum of squares,
	degrees of freedom.
4	<b>Probability</b> : Simple and compound events; conceptual approaches: classical
	probability, relative frequency, and subjective probability; marginal and
	conditional probabilities; independent, dependent and complementary events;
	intersection of events and the multiplication rule; union of events and the
	addition rule; counting rule; factorials, combinations, and permutations.
5	Discrete Variable Probability Distributions: discrete versus continuous random
	variables, probability distributions of random variables and their mean/standard
	deviation; binomial distribution; hypergeometric distribution; Poisson distribution.
	Please note that reading week occurs from Feb. 20 – 25 <sup>th</sup> , no scheduled classes
•	during this time
6	Continuous Variables and the Normal Distribution: continuous probability
	distribution; normal and standard normal distributions; z-scores and the z-table;
	standardizing a normal curve; one and two-tailed regions, calculating x-values;
-	level of significance; normal approximation to the binomial distribution.
7	<b>Sampling Distributions</b> : population distribution; sampling distribution and
	sampling errors; mean, standard deviation and shape of the sampling distribution;
	central limit theorem; applications of the sampling distribution; population and sample proportions; mean, standard deviation, and shape of the sampling
	distribution of the sample proportion; applications of proportion sampling
0	distributions.
8	<b>Estimation</b> : point and interval estimates of population parameters; confidence levels and confidence intervals; margin of error and required sample size
	estimates; introduction to t-distributions and degrees of freedom; estimation of
	population proportions for large samples
9	Hypothesis Testing – One Sample: null and alternate hypotheses; rejection and
3	non-rejection regions; Type I and Type II errors; one and two-tailed tests;

	confidence levels; hypothesis tests about the mean with known and unknown standard deviation; p-values; critical-value and p-value approaches; t-tests; hypothesis tests about a population proportion.
10	Hypothesis Testing – Two Samples: independent versus dependent samples; inferences about differences in sample and population means given multiple standard deviation relationships; confidence interval estimation; testing for population mean differences in paired samples; hypothesis testing for two population proportions.
11	<b>Chi-Square Distributions:</b> chi-square distributions; goodness-of-fit tests; observed and expected frequencies; tests of independence and homogeneity; contingency tables; population variance.
12	<b>Analysis of Variance:</b> F distributions; one-way analysis of variance (ANOVA); sums of squares.
13	<b>Correlation &amp; Regression</b> : Simple and linear regression; scatter diagrams and least squares routines; standard deviation of errors and coefficient of determination; correlation coefficients, mean predictions and confidence intervals, prediction intervals.
14	Research Project Presentations
Final Exam	Apr. 24, 2023 9:00 – 12:00
